

How we repurpose hair, metals and residual hair dye waste!

GCS collection

Hair

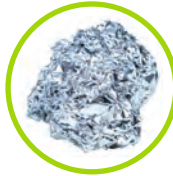

Oil adsorbent booms are created at Allouette Correctional Centre for Women

Booms can be donated for oil spills

Metals

Chemicals are removed by filtration or high-heat incineration in the closed loop smelting process

The waste is either neutralized in a storage tank or used to create additional energy

Residual Hair Dye Waste

Through a centrifugation process, the liquid portion is spun out and neutralized into salts and water and can return to the waste water stream

The solid components that contain chemical compounds, including lead acetate, are diverted to a landfill designated for hazardous waste

Everyone is involved and everyone wins when we work together to keep people and our planet beautiful
